

This is part of **Family API** which allow to create dual-os version of program runs under OS/2 and DOS

**Note:** This is legacy API call. It is recommended to use 32-bit equivalent

## DosPutMessage

This call outputs the message in a buffer passed by a caller to the specified handle. The function formats the buffer to prevent words from wrapping if displayed to a screen.

### Syntax

DosPutMessage (FileHandle, MessageLength, MessageBuffer)

### Parameters

;FileHandle (USHORT) - input : Handle of the output file or device. ;MessageLength (USHORT) - input : Length of the message to be output. ;MessageBuffer (PCHAR) - input : Address of the buffer that contains the returned message.

### Return Code

rc (USHORT) - return Return code descriptions are: \* 0 NO\_ERROR \* 6 ERROR\_INVALID\_HANDLE \* 19 ERROR\_WRITE\_PROTECT \* 321 ERROR\_MR\_UN\_PERFORM

### Remarks

Screen width is assumed to be 80 characters. The DosPutMessage call counts a CR/LF in the 80 characters that it tries to write to the screen. If a word extends past column 78, it is put on the next line. DosPutMessage assumes the starting cursor position is column one when handling a word wrap.

If the last character to be positioned on a line is a double-byte character that would be bisected, the rule above ensures that the character is not bisected.

### Example Code

## C Binding

```
<PRE> #define INCL_DOSMISC
```

```
USHORT rc = DosPutMessage(FileHandle, MessageLength, MessageBuffer);
```

```
USHORT FileHandle; /* Handle of output file/device */ USHORT MessageLength; /* Length of message  
buffer */ PCHAR MessageBuffer; /* Message buffer */
```

```
USHORT rc; /* return code */ </PRE>
```

## MASM Binding

```
<PRE> EXTRN DosPutMessage:FAR INCL_DOSMISC EQU 1
```

```
PUSH WORD FileHandle ;Handle of output file/device PUSH WORD MessageLength ;Length of message  
buffer PUSH@ OTHER MessageBuffer ;Message buffer CALL DosPutMessage
```

```
Returns WORD </PRE>
```
