# Int 23H

## Version

1 and higher

## Brief

CONTROL-C/CONTROL-BREAK HANDLER

## Family API

## Input

none

## Return

1. -DOS 1.x—

AH = 00h abort program

```
if all registers preserved, restart DOS call
---DOS 2+---
CF clear
  all registers preserved
return via RETF with CF set or (MS-DOS 1,DR DOS) RETF 2 with CF set
  DOS will abort program with errorlevel 0
else (RETF/RETF 2 with CF clear or IRET with CF ignored)
  interrupted DOS call is restarted
```

# Macro

## Notes

this interrupt is invoked whenever DOS detects a ^C or ^Break; it should never be called directly

MS-DOS 1.25 also invokes INT 23 on a divide overflow (INT 00)

MS-DOS remembers the stack pointer before calling INT 23, and if it is not the same on return, pops and discards the top word; this is what permits a return with RETF as well as IRET or RETF 2

MS-DOS 2.1+ ignores the returned CF if SP is the same on return as it was when DOS called INT 23, so RETF 2 will not terminate the program

Novell DOS 7 always pops a word if CF is set on return, so one should not return with RETF 2 and CF set or IRET with the stored flags' CF set

any DOS call may safely be made within the INT 23 handler, although the handler must check for a recursive invocation if it does call DOS
